GUIDE TO THE PORTFOLIO OF AIR CONDITIONING UNITS

ABOUT MANDÍK, a.s.

MANDÍK, a. s. is a Czech family company, established in 1990. Today, it's one of the most important manufacturers of HVAC and fire-fighting components as well as air conditioning units and industrial heating systems.

Its success on the European market is based in particular on top quality, flexibility and services related to the support of supplied products.

The actual technical proficiency of the company is highlighted by provision of products to various European cities, tunnels and nuclear power plants.

Our company complies with the Quality Management regulations according to ISO 9001, KTA 1401, and 10CFR APP10, and is a member of the German RLT and EUROVENT associations of air conditioning manufacturers.

The company has all the necessary certification according to European standards and is the holder of Eurovent and the RLT-TÜV-01 certification for energy efficiency determination as well as of the TÜV SÜD Industrie Service GmbH certification according to EN 1886.

From a territorial point of view, besides the domestic market, MANDÍK, a. s. also covers 30 other countries worldwide where our products are supplied in cooperation with our foreign partners. The share of exports is getting close to 75% of all our products.

The registered seat of the company is in Hostomice, in the district of Beroun, while the area of administrative, manufacturing and storage premises exceeds 9,000 m².

This company has over 200 employees in sales, administration, manufacturing and servicing.

During daily activities, an emphasis is placed on environmental protection and occupational safety. The meeting of strict EU standards in these areas is a common rule for our company, required by the management without any compromise. In terms of helping to protect the environment, our company operates its own renewable sources of energy and uses energy efficient appliances.

Our goal is to achieve maximum satisfaction for our customers and last but not at least, to create a high-quality environment for the company employees.

We always strive to meet the demands and requirements of our customers in full. Each structure has its specific requirements, therefore we employ experts who always try to find the best and the most economical solution.

Mandík a.s. own sophisticated designing software, prepared for both internal needs as well as for our customers, who are companies focused on designing and execution. Our software provides detailed and sophisticated technical and pricing offers.

In the event of any trouble at construction, our servicing department is there for you, always endeavouring to find the right solution for any problem or uncertainty related to our products.

EUROVENT CERTIFICATION

EUROVENT Certita Certification is a French organisation, certifying parameters of air conditioning and cooling equipment according to EU and international standards.

Auditor: Eurovent

Laboratories: model box – TÜV-SÜD Mnichov Real unit – TÜV -NORD Essen

Conditions for the certification to be granted as follows:

- becoming a member of the Eurovent organisation
- perform laboratory measurements for the properties of model box coating according to EN1886
- perform laboratory measurements for performance parameters of a real unit as well as of selected properties of coating according to EN1886
- successfully complete audit of a selective program and its calculations
- successfully complete the audit of manufacturing procedures and quality policy

The result of a successful certification is the following:

- TÜV-SÜD certification issued according to the EN 1886 standard for coating properties
- Eurovent certification issued for a selective program and a proposal for energy efficiency classes for certified HVAC units' series

auditor: Eurovent

laboratory: model box – TÜV-SÜD Munich, real unit – TÜV -NORD Essen

The values measured during the testing of a real unit are compared with their technical specification in detail, created in a selective program. If any deviations are found at the compared values that are beyond the tolerance, further steps follow including the re-design of a structural solution and a new test, correction of the calculation, correction of solutions, etc. The process of a so-called recalculation does not end until the output values of a technical specification in the selective program are corresponding to the measured real state.

During the audit of a selective program, applied components will be checked further (fans, regenerative air heater, heat exchangers, etc.) as well as the reliability of their calculation.

For each unit, designed with certified software, the energy class will be displayed according to the table such unit belongs to. An energy label is then printed for the unit specification.

RLT – TÜV CERTIFICATION

RLT is an association of air conditioning manufacturers from Germany and other countries. They are designated as the quality guardians for central HVAC units.

Auditor: Eurovent

Laboratories: model box – TÜV-SÜD Munich Real unit – TÜV -NORD Essen

Conditions for the certification to be granted are as follows:

- becoming a member of the RLT association
- perform laboratory measurements for the properties of model box coating according to EN1886
- successfully complete the audit of a selective program and its calculations
- successfully complete the audit of manufacturing procedures and quality policy

The result of a successful certification is as follows:

- TÜV-SÜD certification issued according to the EN 1886 standard for coating properties
- TÜV-SÜD certification issued for a selective program according to the RLT directive as well as the proposal of energy classes of certified series for HVAC units

auditor: TÜV-SÜD Munich, laboratories: model box – TÜV-SÜD Munich

During the RLT certification, the mechanical properties of coating are measured according to the EN 1886 standard by the TÜV-SÜD testing facility, followed by a certification of the selective program.

Certification of the program according to the RLT directives contains a review of Ekodesign implementation according to EU Commission regulation No. 1253/2014. All the necessary information according to this regulation must be mentioned in the technical specification of units placed to the market.

TÜV-SÜD also reviews the use of components (regenerative air heaters, fans, etc.) that must be verified by TÜV-SÜD laboratory measurements. These certified components are necessary for the calculation and issue of energy labels for the A+, A and B classes, while their calculation algorithm is also checked within the process of certification.

BUILT-UP AIR CONDITIONING UNITS of the M, P and T series

■ Performance of units

Air conditioning performance of the respective units starts from 500 m3/h (0.1 m³/s) and ends at over 100,000 m³/h (27.8 m³/s).

Performance of water heaters up to 650 kW, electrical heater up to 570 kW, gas heaters up to 610 kW per one exchanger and the direct coolers' performance up to 1.000 kW.

■ Structure

Built-up air conditioning units are fully manufactured and certified in a unique frame-free form.

This unit offers a huge variability of cross-section. It's offered in a configuration with a rectangular and square cross-section.

Unit may be manufactured in a standard configuration as a standing unit – inlet and outlet parts are on top of each other / next to each other or as ceiling units.

Product Certificate

■ Size

Built-up Mandík units contain 89 typical sizes in total with a square, rectangular and transport cross-section.

Dimensions:

- height: 400-4050 mm
- width: 450-3600 mm
- length: modular

Application and configuration

Units are designed for both indoor and outdoor use. Potential configuration of internal and external coating from a purely zinc plate, powder coated zinc plate or from a stainless plate (AISI 304).

Design of units for a standard environment (administrative buildings, shopping centres, kitchens, sport halls, warehouses, etc.), hygienic conditions (hospital, clean premises, food industry, etc.) and ATEX for the environment with a danger of explosion (painting facilities, warehouses for volatile substances, paper mills, etc.)

■ Functionalities

Units are highly variable and may secure functions like air distribution and filtration, different types of heat recovery, heating and cooling of air, moisturizing and dehumidification, circulation and others...

Mandík also supplies full-scale measurement and control for indoor or outdoor designs for its air conditioning units.

Details

Units have a smooth inner surface without any needless protuberances or folding in their standard design without any additional adjustments.

Access for maintenance into units is secured by a maintenance door with handles and hinges or by maintenance boards, fixed by clips, or by safety high-pressure closings serving also as handles or hinges.

■ Certifications

Coating certification for units from Munich TÜV-SÜD laboratories

Possibility to design units in energy classes up to A+ according to the requirements of the German association of RLT HVAC units' manufacturers

Certification of the European industry association of the EUROVENT ventilation and cooling equipment manufacturers.

■ Ecodesign

Units distributed to EU member countries must comply with EU Commission regulation No. 1253/2014, the Ecodesign. Certification that the unit complies with the regulation secures for each HVAC unit a proper ratio between the air velocity, pressure losses of components, efficiency of heat recovery and the total power supply of the unit in relation to its performance.

Mandík units meeting this European Commission regulation can be distinguished according to the labels and the summary of basic parameters in the technical specification that the Ecodesign requires.

RECOVERY

Units may contain various types of recovery (board, rotary, liquid) of different dimensions, efficiencies and surface adjustments. Efficiencies are in a range from 60 to 90%. Anti-freeze protection is included as standard.

CAMP HIVE

Mandík air conditioning units use the Climatix Siemens programmable PLC control. Thus, comfortable, safe and economical operation of the equipment is ensured. This ensures easy control and cooperation with the BMS system.

FANS

There are fans in the chambers with freely moving blade wheels and vanes curved backwards (Plug fan). It may be designed with EC motors or asynchronous motors with a frequency converter. They can be fixed to the floor or to the front chamber board.

UNIT STRUCTURE

The Mandík air conditioning unit is made of a special self-standing frame-free structure. The coating has great D1 mechanical stability parameters, high L1 tightness, a low TB2 thermal bridge coefficient and T3 heat transfer.

FILTERS

Units may contain different types of filters (pocket, compact, frame, metal, with activated carbon, etc.). Filtration classes from G3 by F9 (HEPA filters for special demand).

CONTROL **DAMPERS**

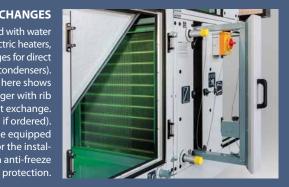

Construction of the damper by ourselves from aluminium profiles with plastic bearings of tightness class 2 (or 4 if ordered) and thermal resistance of 80 °C.

Unit coating is made of a zinc plate with the possibility to adjust is by powder paint to any colour (potentially from a stainless steel). Unit coating is precisely smooth to limit the deposits of dust and enable better cleaning.

Units may be equipped with water heaters and coolers, electric heaters, gas heaters or exchanges for direct vaporization (vaporizers, condensers). For example, the image here shows a water heat exchanger with rib arrangement for the heat exchange. Cu/Al (also Cu/Cu if ordered). The chamber could be equipped with a foldable frame for the installation of a capillary of an anti-freeze

UNIQUE COATING OF BUILT-UP AIR CONDITIONING UNITS of the M, P and T TÜV-SÜD Munich testing facility

Built-up air conditioning units are fully manufactured in a unique certified frame-free design.

Chambers are made of isolated, multi-layered panels from a galvanized zinced steel plate of 0.8 mm – Z275 EN10346 connected by screws between each other. The width of the coating panels is 50 mm. Inside the panels there is standard thermal and noise insulation applied with a specific gravity of 65 (50) kg/m³. In case of interest, a stainless (AISI 304, ČSN 17240) or painted plate may also be used with any RAL colour standard. Sealing between the panels is secured with a self-adhesive EPDM sealing with closed pores.

On the basis of EUROVENT and RLT requirements, laboratory tests of the coating of the Mandík units has to be performed.

Coating parameters are certified by the TÜV-SÜD Munich testing facility according to the EN 1886 standard:

Mechan	ical stabilit	ty				D1 (N	И), D1 (R)
Housing	g leakage .					L1 (l	M), L1 (R)

REFERENCES IN THE CZECH REPUBLIC for the M, P and T series

King's Casino, Rozvadov

During 2015–2017, 8 air conditioning units were supplied for this project with a total air flow rate of 100 000 m³/h.

Hala míčových sportů (Hall for Ball Sports), Karlovy Vary

In 2014, Mandík a.s. supplied 4 air conditioning units with a total performance of 56,500 m³/h.

Crystal Prague, Vinohrady

Since 2014, we are holders of a unique reference from this modern office building. In this building, there are 6 units in total of 108,000 m³/h performance.

Hobža Strážnické brambůrky, Strážnice

Since 2013, there is an air conditioning unit installed in the building of this well-known food company with a 6,500 m³/h flow rate.

První brněnská strojírna (First Machinery Plant in Brno), Velká Bíteš

In 2015, we supplied 6 air conditioning from our production into the premises of a machinery plant with a total performance of ca. 79,000 m³/h.

Senior centrum Klamovka, Praha-Košíře

In 2015, 14 of our air conditioning units were installed here with a total air flow rate of 55,000 m³/h.

FOREIGN REFERENCES of the M, P and T series

Nuclear Power Plant, CHERNOBYL, UKR

In 2016–2017, 39 pieces of atypical built-up Mandík units with a performance of 365,000 m³/h were supplied to this unique sarcophagus construction project for a nuclear power plant after a meltdown.

ZELLSTOFF Rosenthal Papierfabrik, Blankenstein, DE

In 2015, we supplied 2 P16 air conditioning units with a total air flow rate of ca. 18,000 m³/h for this manufacturing plant.

DEUTZ Wellenzentrum, Cologne, DE

During 2016, 4 giant P80 air conditioning units and one small M14 unit were supplied for this building with a total performance of ca. 248,000 m³/h.

VALIO, Riihimäki, FIN

In 2015, we supplier 65 air conditioning units with a total performance over 300,000 m³/h for this food production factory.

MEGA SITI SUPERMARKET – Samara, RU

Since 2006, we have 14 P25 air conditioning units installed at this shopping centre with a total performance of around 350,000 m³/h.

DONGIL RUBBER BELT, Povážská Bystrica, SK

In 2016, we supplied 10 built-up air conditioning units with a total air flow rate of 268,000 m³/h for this manufacturing plant in the automotive industry.

COMPACT AIR CONDITIONING UNITS of the CPV series

■ Performance of the units

The performance of compact units reaches an air flow rate from 500 m³/h (0.1 m³/s) to 6,000 m³/h (1.7 m³/s).

■ Structure and details

Compact air conditioning units are completely produced in a unique frame-free design.

Units have a smooth inner surface without any needless protuberances or folding in their standard design without any additional adjustments.

All the air connections are placed at the top and only optionally to the side.

The compact unit is designed to allow ideal access for maintenance or servicing for each unit component through the maintenance door.

Servicing access to the unit is secured with a door equipped with high-pressure safety closings.

■ Size

Compact CPV units are supplied in 5 dimensions, depending on the nominal performance of the air conditioning unit.

Dimensions:

height: 1255–2165 mmwidth: 690–1135 mmlength: 1570–3000 mm

Application and design

Units are designed for an indoor environment.

The inner and outer coating can be made with zinced plate or treated with a powder paint.

Units designed for standard environment (administrative buildings, shopping centres, kitchens, sporting halls, warehouses, etc.).

■ Functionalities

These units ensure the air distribution and filtration, heat recovery, heating and cooling of air.

Our compact units are equipped with complete measurements and control with a "Plug & Play" system.

Components

These units contain a highly effective recovery exchanger using counter flow.

There are EC fans applied with a high margin for the required external pressure applied on pipes.

Compact filters in the inlet and outlet.

Potential additional heating – water, electric or condenser.

Cooling possible – evaporator, water cooler.

Integrated motorized dampers at the inlet, outlet and at the recovery bypass.

Possibility of mixing the fresh air with outlet air by using a mixing damper for the optimisation of heat performance.

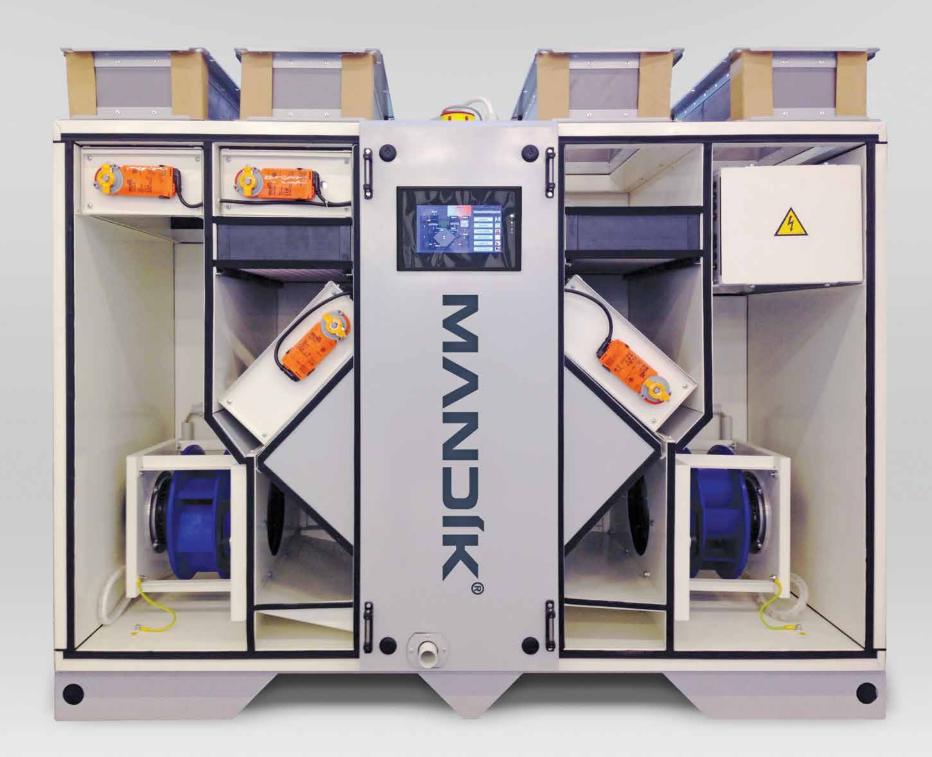

Declaration of conformity

Product certificate

REFERENCES for the CPV series

Grandhotel AMBASSADOR, Karlovy Vary

At the end of 2016, a compact CPV air conditioning unit was installed in this famous hotel with an air flow rate of 3,600 m³/h.

Řetězec posiloven ExtraFit (ExtraFit fitness chain), Cologne, DE

At the end of 2016 and at the beginning of 2017, 4 compact CPV 24 units and 60 units with additional cooling and a total flow rate of 13,200 m³/h were supplied.

Veterán Klub, Třinec

In 2016, a new construction was executed with the supply of compact CPV air conditioning units with a total performance of 4,800 m³/h.

Freie Waldorfschule, Evinghausen, DE

In 2016, compact CPV 48 units with a total performance of 9,600 m³/h were installed.

Bytový dům Vejvarovského (Vejvarovského building with appartments), Kroměříž

In 2017, compact CPV air conditioning units were supplied for this building with a total performance of 4,800 m³/h.

Sportovní škola (Sport academy), Wedau, DE

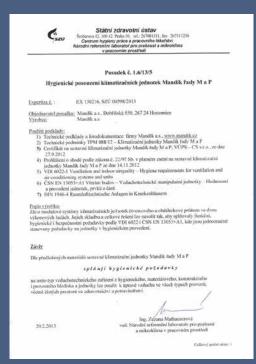

In 2017, a compact CPV 24 unit with a performance of 2,400 m³/h was supplied.

SPECIAL APPLICATIONS – HYGIENIC BUILT-UP UNITS

Before starting with the design of this unit, it's necessary to know the difference between a unit with a "hygienic" design and a unit with a certificate of "hygienic safety and capability of the product to distribute air" (it must have all of its HVAC units placed to the market). Units with a hygienic design are made in a way to avoid even small deposits of dust or moulds and to allow a trouble-free and quick restoration of the internal parts of the unit.

These units were granted the following certificates:

Principles and adjustments of units with a hygienic design:

- Chambers with a smooth internal surface, without any needle protuberances, foldings, bendings or connecting elements
- This unit may be supplied with a zinced, plainted or stainless coating (components inside are painted
- Only tight recovery types such as the board recovery exchanger or a highly effective glycol loop
- Units are designed for an air velocity of 2.5 m/s at the cross-section
- Special noise attenuator bodies are used
- Multistage filtration used (prefilter, 2nd and potentially also a 3rd stage of
- Special drop eliminator in an aluminium configuration
- Possibility of installing HEPA filters into the air conditioning unit chambers
- Free servicing chamber for the correct cleaning and exchange of heater, coolers, filter, etc.
- Maintenance door with inspection peepholes or glass and lighting inside the chambers

REFERENCES FOR THE HYGIENIC UNITS

Oblastní nemocnice (district hospital) Mladá Boleslavl | Oncology department

In 2015, 7 air conditioning units with a total air flow rate of 20,000 m³/h were supplied.

Ústřední vojenská nemocnice, Praha (Central military hospital Prague) Centre for forensic medicine

In 2015, we supplied 6 air conditioning units with a total air flow rate of 20,500 m³/h.

Nemocnice Rudolfa a Stefanie (Rudolf and Stefanie Hospital), Benešov Magnetic resonance

In 2015, we supplied an air conditioning unit for the magnetic resonance ventilation with a 2,700 m³/h air flow rate.

Fakultní nemocnice Motol, Praha (Motol University Hospital in Prague)

In 2017, over 20 pieces of built-up air conditioning units with a total performance over 110,000 m³/h were supplied.

Fakultní nemocnice, Olomouc (University Hospital in Olomouc) Pharmacy building

In 2014, Mandík a.s. supplied 5 air conditioning units with a total performance of 39,000 m³/h.

Nemocnice Milosrdných Bratří (Milosrdných Bratří Hospital), Brno

During the years 2014–2016, we supplied 2 air conditioning units with a total air flow rate of 13,000 m³/h

SPECIAL APPLICATIONS – ATEX UNTIS FOR AN EXPLOSIVE ENVIRONMENT

ATEX units, produced by Mandík, are adjusted to avoid ignition by electrostatic charge. All the electrically non-conductive connections are interconnected conductively (e.g. the connection of chambers between them and the base frame, attenuating inserts with unit coating, etc.). All the metal components of this unit must be conductively connected with a Cu conductor.

Only certified drives (fan + motor) may be used for ATEX. All the electrical components must have an earth connection using a central earthing point situated on the fan chamber. All the connections must be secured against incidental loosening in a secure way. It's necessary to have protection against lightning. The revision and servicing hole must be equipped with a protective mesh grid. If condensation forms in the units, a special droplet eliminator in an aluminium configuration is used.

At Mandík, it's possible to order certification No. 210 from authorized person from a physical and technical testing facility in Ostrava-Radvanice that will subsequently publish the certificate, granting the unit the EX sticker.

PROHILÁSENÍ O SHODĚ Pode odkren (23/1997 SL), a technických poladovních ou vjouky va zobě pozdějích rotin a dopěšía a § 2 cite. 1, § 2 s f Pode odkren (23/1997 SL), a technických poladovních ou vjouky va zobě podejích za právních vývněje. Divě (21/2007 Sl. Europi na stamus poladovný na zdrož a optiou podejích podejích podejích za podejích

Mandík air conditioning units may be used in an explosive environment:

- Ex-zone: 1; 2
- Equipment class: II
- Category of equipment: 2; 3
- Explosive atmosphere: G
- Category of gases: IIA; IIB
- Temperature class: T1-T4

Units are designed according to the following standards:

- ČSN EN 13463 non-electrical equipment for an environment with the danger of explosion
- ČSN EN 1127 explosive environment
- ČSN EN 60079-20 Explosive atmospheres

SPECIAL APPLICATIONS – AIR CONDITIONING UNIT WITH A HEAT PUMP

Attention! Units with heat pump are not EUROVENT certified!

Built-up air conditioning units designed for central distribution and a make-up of air for industrial or commercial use. The air conditioning unit with an integrated heat pump is a special option in standard MANDÍK air conditioning units in the M and P series. These units contain an air-air recovery exchanger and an integrated cooling circuit with or without a reversible operation for additional cooling or for additional heating of the supplied air.

- Their advantage is the high efficiency of the equipment (energy class A+). That means very low operational costs.
- They secure the distribution and make-up of air under high efficiency of operation with low operational costs.
- They are produced with a performance from 500 to 25,000 m3/h.
- Units are completely produced and certified in a unique frame-free design.

- This unit may be equipped with an independent control and regulation system on the Siemens Climatix platform.
- Units are made in an indoor or outdoor design.
- The heat pump circuit may be supplied to the construction in a complete, filled and tested condition or the circuit may be assembled and commissioned at the site. It depends fully on the size of such unit or on the requirements of the customer or of the site.
- 2 30 0

- A unit designed with an integrated heat pump is exempt from the regulations of the European Commission No. 1253/2014, the EcoDesign.
- The advantage of these units is the areal non-demanding character and therefore, the need to connect these devices with the units for cooling generation is avoided.
- The compressor loop filling is the ecological R407c or R410a coolant.

OPTIONS FOR THE MANDÍK AIR CONDITIONING UNITS

Board air recovery exchangers with counter flow

It's possible to equip the Mandík air conditioning units with high-quality aluminium air-air heat exchangers with a counter-flow. This type of recovery – called board recovery with counter-flow – is highly efficient for heat distribution under low pressure losses. As a result, the assembled Mandík air conditioning units save more thermal as well as inlet electric energy in comparison with a conventional system of board air recovery. Units with this kind of recovery achieve a performance up to 15,000 m³/h.

Over-sized units

Mandik air conditioning units are designed for a standard air flow rate of 500–100,000 m³/h. However, if a customer requests, the air flow rate can be higher than the standard one or the chambers may have atypical dimensions and Mandík is able to increase or adjust the dimensions, meeting the customer's requirements. In our reference projects, you can also find units for 120,000 m³/h or units with chambers with a width over 4,000 mm. The chambers obviously have the declared coating parameters and contain the same equipment as the standard series.

Gas boiler of our own production up to 60 kW performance – Monzun

Mandik air conditioning units can be equipped with Monzun gas air heaters with high pressure boilers with a 15–60 kW performance. This is a combination of tested and reliable gas boilers, adjusted for use in built-up air conditioning units of the M, P and T series. This concept is developed to comply with new EU directive No. 2016 / 2281, the Ecodesign. The heating chamber boiler, including the flue gas lines, is made of stainless steel and is resistant against high temperatures. In the modulation configuration, a continuous control of 60–100% performance is possible. It's designed for fuels such as natural gas, propane-butane or propane. Overheating protection is already implemented in the heater.

Gas / oil condensing boiler up to 600 kW performance - GHM / OHM

Another option is the new GHM / OHM gas/oil condensing air heater with a heating performance of 95–600 kW. The heating chamber boiler, including the flue gas lines, is made of stainless steel and is resistant against high temperature. The zone for personnel, connections for media and flue gas outlets is all in one place and only from one side. It's designed for fuels such as natural gas or light heating oil. You can choose from two burner producers, Weishaupt or Riello. Modulation is possible for a range of 35–100% of performance. Overheating protection is already implemented in the heater. Design for outdoor environment is also an option with a chamber to cover and heat the burner.

SPECIAL PROJECT WITH MANDÍK AIR CONDITIONING UNITS

Chernobyl project

At the end of 2016 and at the beginning 2017, Mandík produced special air conditioning units for a new sarcophagus project at the Chernobyl nuclear power plant in Ukraine that suffered the infamous meltdown.

The enclosure of a steel sarcophagus of 36,000 tonnes and dimensions of $260 \times 165 \times 110$ m was shifted to enclose the old sarcophagus of reactor number 4 at the Chernobyl nuclear power plant that experienced a meltdown, thus becoming the largest moving structure in the world.

Parameters: 39 pcs of air conditioning units of different sizes, total performance over 365,000 m³/h.

Special requirements: Units had to undergo an independent evaluation of seismic resistance of machineries for the nuclear power plants. Moreover, a number of them were manufactured with a design for an explosive atmosphere (ATEX).

Dieter HEIN Project

In 2017, a built-up air conditioning unit, including a compressor loop with high cooling and dehumidification performance was supplied to the premises of the Dieter HEIN company in Germany, who produce and distribute meat products.

Dieter HEIN is based in Osnabrück, Lower Saxony, and it's a family company with over 80-years of tradition in the production of sausages and a number of other meat products.

As the requirements for this unit were high in relation to the dehumidification performance, while the temperature after air cooling had to be lower than -10 °C, two piston compressors were used, working with R448A coolant with an evaporation temperature of -20 °C. A cooling loop reduces the temperature of the air, removes moisture and recovers the heat to the supplied air or removes the heat to the hot water drum.

Parameters: Performance (air flow rate) 3,600 m³/h, cooling performance 48 kW, dehumidifying performance 30 kg/h, heating performance 85 kW.

Clinicum Alpinum AG Project

In 2017, a built-up air conditioning unit from Mandík was supplied in a pool design with an integrated compressor dehumidifying loop for ventilation and air make-up for the pool at Gaflei Clinic in Liechtenstein, situated in the mountains.

The Clinicum Alpinum project is designed mainly for the treatment of diseases caused by stress. Gaflei is situated 1500 m.a.s.l. The capacity of the building is 250 patients with a time period for treatment of 8–12 weeks.

Parameters: Performance of 7,000 m³/h. dehumidifying performance of 50 kg/h. RAL 7004 was used for the paint of the entire unit.

MEASUREMENT AND CONTROL SYSTEM FOR THE AIR CONDITIONING UNITS

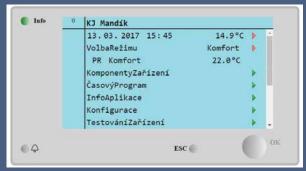

Characteristics

- System proposal for each design option of the Mandík air conditioning units
- Comfortable control of operation by using a freely programmable Siemens Climatix control panel
- Broad communication possibilities cooperation with the majority of the superior systems
- Easy control and full maintenance settings by using display and control panel buttons
- Power supply distributors in a metal or plastic design, depending on the configuration of the air conditioning units

System properties

- Turnkey accurate control of the HVAC operation
- Simple installation and control with additional options
- Local and remote control
- Possibility to choose from more operational modes, weekly and annual time period program
- Text display with a transparent display of all the data
- You can choose the language for your display from any European language (default - Czech language)
- Temperature and humidity control in the inlet or premises

- Automatic recognition of heating or cooling need
- Transparent overview of alarm messages, including the history
- Changes to important parameters only after the password is entered (of more levels)
- Control of all standard external components of the heating and cooling
- Controlled from PC by using an internet browser (standard supply) and subsequently from any internet website
- Potential for a visualisation upgrade

Screen when controlled by HMI@Web

MEASUREMENT AND CONTROL SYSTEM OF AIR CONDITIONING UNITS

The Siemens Climatix control panel of the control unit for air conditioning units transmits all the required data about the unit operation, condition of respective components, data from respective sensors, etc. in certain intervals at the site into the Cloud Mandík storage where the user may monitor and change them in real time.

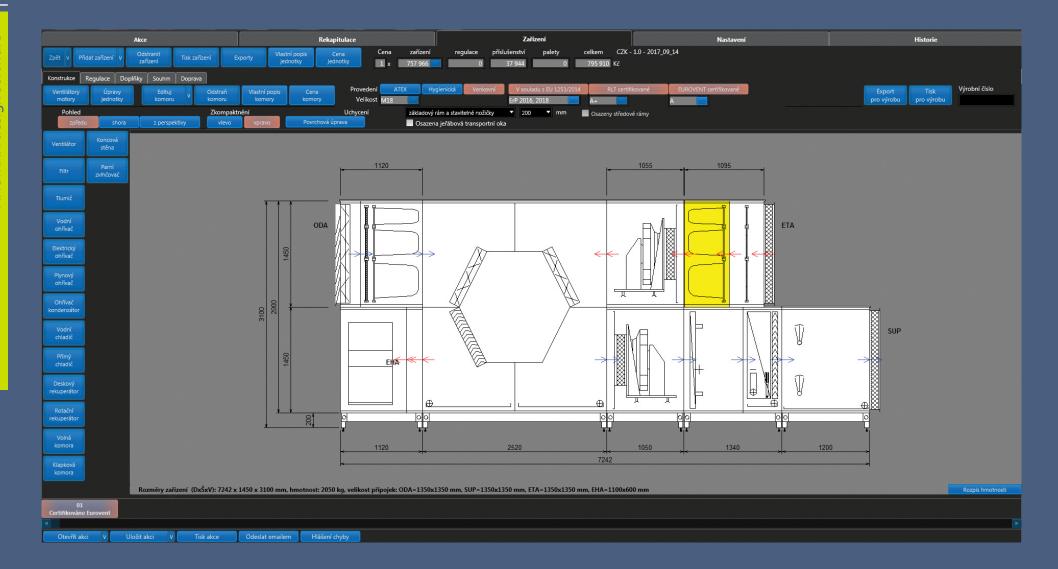

Mandík's Cloud function:

- 3 levels of access, each of which is protected with its own password, has a different access to the units and different possibilities of manipulations therewith:
 - 1. Manufacturer's access administration of users and passwords, online update of the control program for the control panel, etc.
 - Access for assembly companies provides remote administration and servicing of all the connected units at the end users, significantly saving costs related to these tasks
 - 3. End user access provides remote administration of all the connected units, controlled by the operator
- Connection of the Climatix control panel to the Mandík Cloud may be performed in two ways:
 - Control panel is connected to the Cloud on the internet via a router with a prepaid SIM card and data tariff
 - Control panel is connected to the internal computer network in the building via an internet connection and thereby to the cloud
- Possible connection by using a PC, tablet, smartphone
- This service is paid

- Service is accessible 24/7, 365 days a year
- Online support during commissioning
- Detecting the right connection of sensors, warning about potential defects
- In the event that a software update is necessary, e.g. following a request from the customer, the change and loading is done online
- Online monitoring of data points like power, power supply, temperatures
- In the event of the malfunction of the unit, it's not necessary to call the servicing technicians to come, but the cause can be detected online
- The user may see the data points (power, power supply, temperatures, ...) as charts in time
- The user sees the online notification for alarms of the control unit and the statements of these alarms, including their description and times when they occurred
- The user may adjust the look of the entire screen with panels, charts and alarms according to his own wish
- In the application, there is the possibility for a standard internet access so-called HMI@Web for the control of the entire unit, respective components or the shutdown or turning on the entire unit

- In the Cloud, the user may store all the necessary documentation for the unit like the technical specification, assembly, maintenance and servicing manual, diagram for connections, certificates, etc.
- By using the Cloud, it's possible to very comfortably configure a weekly period program
- Data collected in time (year, week, day, hour, etc.) may be easily exported as a file (MS Excel) from the Cloud and used for working thereafter
- The user may set the notifications for regular maintenance that the Cloud will send him onto his map and main screen

SOPHISTICATED AHUMAN DESIGN SOFTWARE

AHUMAN software is designed for setting, calculations and pricing for built-up air conditioning units from Mandík of the M, P and T types.

In this software, the user may set the air conditioning unit according to his wishes by using the prepared components.

The prerequisite for a successful design of the unit is the knowledge about the basic functionalities of the respective elements, forming this unit.

In the software, you can choose from the following components:

- Recovery air exchangers board, rotary or liquid
- Fan chambers with AC, EC or PM motors
- Heating chambers water, electrical, gas or condensing
- Chambers of the coolers water or direct evaporators
- Filters frame, pocket, compact, grease or filters with active charcoal
- Noise attenuators
- Chambers with dampers
- Chambers for steam humidifiers
- Free chambers for additional elements or for turning the air flow
- Base frames, fixed or assembling, bridges
- Attenuating connecting inserts
- Accessories for an outdoor design of units like roofs, exhaust supports, veins, etc.
- Measurement and control distributors for indoor and outdoor use
- Water control fittings
- Transporting crane ring lugs
- Other accessories

The software performs calculations for the recovery of air exchangers, fans and exchangers in the actual libraries of the suppliers for these components. For the other HVAC elements, it performs its calculations on the basis of its own algorithms.

The software provides a detailed technical outcome for built-up air conditioning units and displays all the necessary data from the flow rate, pressures and media temperature, through to the power supply for the fans with the performance parameters of the recovery exchangers, heaters and coolers.

Part of the technical specification are drawings with the unit dimensions, a statement containing all the parameters required by the EU 1253/2014 directive and the assessment of the compliance of the proposal for the established assembly with the requirements of this directive.

Furthermore, all the respective calculations and the inclusion of the assembly into the energy efficiency classes, including the certificates the unit is granted (as e.g. Eurovent, RLT or TÜV-SÜD), are displayed.

At the end, this software calculates all the dimensions of the transported blocs, their weight and the proposal for transport blocs for the transportation to the customer.
